Angles and segment measures are real numbers; therefore, we can do operations with them (add, subtract, multiply, divide) and apply equality properties to them. We can only do that, however, when we are using their
$\qquad$ not the fact that they are congruent (i.e., not when we have a $\qquad$ sign).

Example 1: Can we apply operations to the following statements?
A) $\mathrm{RT}=\mathrm{PQ}$ $\qquad$ B) $\overline{H I} \cong \overline{K U}$ $\qquad$ C) $\mathrm{m} \angle \mathrm{ABC}=\mathrm{m} \angle \mathrm{DEF}$ $\qquad$ D)
$\angle \mathrm{A} \cong \angle \mathrm{B}=$ $\qquad$
Practice 1: Can we perform operations and/or apply equality properties to the following statements?
A) $\overline{Q R} \cong \overline{S T}$ $\qquad$ B) $\mathrm{m} \angle \mathrm{K}>\mathrm{m} \angle \mathrm{T}$ $\qquad$ C) $P Q=M L$ $\qquad$ D) $\angle \mathrm{CAT} \cong \angle \mathrm{DOG}$

If we need to go between congruency and equality, though, we can use the definition of congruency, which states that If $\mathrm{AB}=\mathrm{XY}$, then $\qquad$ —.

Example 2: If we use the definition of congruency on the following statements, what would be the new statement?
A) $\mathrm{YU}=\mathrm{MQ}$
B) $m \angle \mathrm{~N}=\mathrm{m} \angle \mathrm{H}$ $\qquad$ C) $\overline{A M} \cong \overline{M B}$
D) $\angle \mathrm{M} \cong \angle \mathrm{Y}=$ $\qquad$ E) $\mathrm{ML}>\mathrm{ST}$ $\qquad$

Practice 2: If we use the definition of congruency on the following statements, what would be the new statement?
A) $\overline{Q R} \cong \overline{S T}$
B) $m \angle K \leq m \angle T$ $\qquad$ C) $P Q=M L$ $\qquad$
D) $\angle \mathrm{CAT} \cong \angle \mathrm{DOG}$ $\qquad$ E) $m \angle K>m \angle T$ $\qquad$

When we are just saying what something is, and it is not given, we use definitions. When performing operations and applying equality properties to angle and segment measures, we work mostly with definitions and postulates. Theorems are used when the segments and angles are already congruent. For example, if we are told that a point is the midpoint of a segment, and we are going to perform operations with the measures of those segments, then we would use the of midpoint. If we are told that the point is the midpoint, and we just want to use the fact that each of the two halves are congruent, then we would use the midpoint $\qquad$ .

Here are some definitions and postulates that frequently appear in proofs dealing with measures:
Definition of a right angle: If an angle is a right angle, then its measure is $\qquad$ _.
Definition of complementary angles: If two angles are complementary, then their sum is $\qquad$ .
Definition of supplementary angles: If two angles are supplementary, then their sum is $\qquad$ .
Definition of perpendicular lines: If two lines are perpendicular, then they form $\qquad$ angles.

Definition of Congruency: If $\overline{Q R} \cong \overline{S T}$, then $\qquad$
Definition of a Midpoint: If M is the midpoint of $\overline{A B}$, then $\qquad$
Segment Addition Postulate: If K lies between J and L, then $\qquad$
Definition of Congruency If $A B=X Y$, then $\qquad$
Definition of Supplementary Angles: If $\angle \mathrm{X}$ and $\angle \mathrm{Y}$ are supplementary, then $\qquad$ $+$ $\qquad$ $=$ $\qquad$
Definition of Complementary Angles: If $\angle \mathrm{X}$ and $\angle \mathrm{Y}$ are complementary, then $\qquad$ $+\ldots=$ $\qquad$
Definition of a Right Angle: If $\angle \mathrm{K}$ is a right angle, then $\qquad$ $=$ $\qquad$
Definition of Congruency: If $\angle \mathrm{P} \cong \angle \mathrm{D}$, then $\qquad$ = $\qquad$
Angle Addition Postulate: If R is in the interior of $\angle \mathrm{PQS}$, then $\qquad$ $+$ $\qquad$ $=$ $\qquad$

Overall, if you want to state that two angles or segments are congruent, you would use a theorem. If, after that, you need to perform operations with the angles or segments measures, then you would use the definition of congruency to go from congruence to measures. After that, you can apply the equality properties (i.e., addition, subtraction, multiplication, division, reflexive, symmetric, transitive, substitution, simplification)

Example 3: Complete the proof below:
Given: M is the midpoint of $\overline{A B} \quad$ Prove: $\overline{A M} \cong \overline{M B}$

| Statements | Reasons |
| :--- | :--- |
| 1. | 1. |
| 2. | 2. |
| 3. | 3. |

Example 4: Complete the proof below:
Given: $\overline{J K} \cong \overline{Q T} ; \mathrm{JK}=3 \mathrm{x}+5 ; \mathrm{QT}=2 \mathrm{x}+8$
Prove: $\mathrm{x}=3$

| Statement | Reason |
| :--- | :--- |
| 1. $\overline{J K} \cong \overline{Q T} ; \mathrm{JK}=3 \mathrm{x}+5 ; \mathrm{QT}=2 \mathrm{x}+8$ | 1. |
| 2. $\mathrm{JK}=\mathrm{QT}$ | 2. |
| 3. $3 \mathrm{x}+5=2 \mathrm{x}+8$ | 3. |
| 4. $\mathrm{x}+5=8$ | 4. |
| 5. $\mathrm{x}=3$ | 5. |

Practice 3: Given: M is the midpoint of $\overline{O G} ; \mathrm{OM}=\mathrm{x}+4 ; \mathrm{MG}=5(3 \mathrm{x}-2)$
Prove: $\mathrm{x}=1$
Draw a sketch:

| Statement | Answers | Reason |
| :--- | :--- | :--- |
| 1. M is the midpoint of $\overline{O G} ;$ <br> $\mathrm{OM}=\mathrm{x}+4 ; \mathrm{MG}=5(3 \mathrm{x}-2)$ |  | A. Substitution |
| 2. $\mathrm{OM}=\mathrm{MG}$ |  | B. Subtraction Prop. |
| 3. $\mathrm{x}+4=5(3 \mathrm{x}-2)$ |  | C. Division Prop. |
| $4 . \mathrm{x}+4=15 \mathrm{x}-10$ |  | D. Given |
| 5. $-14 \mathrm{x}+4=-10$ |  | E. Distributive Prop. |
| 6. $-14 \mathrm{x}=-14$ |  | F. Subtraction Prop. |
| 7. $\quad \mathrm{x}=1$ |  | G. Definition of a midpoint |

Practice 4: $\quad$ Given: $\mathrm{PQ}=\mathrm{RS}$ Prove: $\mathrm{PR}=\mathrm{QS}$

| Statement | Reason |
| :--- | :--- |
| $1 . \mathrm{PQ}=\mathrm{RS}$ | 1. |
| $2 . \mathrm{PQ}+\mathrm{QR}=\mathrm{RS}+\mathrm{QR}$ | 2. |
| $3 . \mathrm{PQ}+\mathrm{QR}=\mathrm{PR}$ <br> $\mathrm{RS}+\mathrm{QR}=\mathrm{QS}$ | 3. |
| $4 . \mathrm{PR}=\mathrm{QS}$ | 4. |

Example 5: $\quad$ Given: $\angle \mathrm{O}$ and $\angle \mathrm{K}$ are supplementary
Prove: $x=25$
$\mathrm{m} \angle \mathrm{O}=(4 \mathrm{x}+10)^{\circ} ; \quad \mathrm{m} \angle \mathrm{K}=(3 \mathrm{x}-5)^{\circ}$

| Statement | Reason |
| :--- | :--- |
| 1. $\angle \mathrm{O}$ and $\angle \mathrm{K}$ are supplementary <br> $\mathrm{m} \angle \mathrm{O}=(4 \mathrm{x}+10)^{\circ} ; \mathrm{m} \angle \mathrm{K}=(3 \mathrm{x}-5)^{\circ}$ | 1. |
| 2. $\mathrm{m} \angle \mathrm{O}+\mathrm{m} \angle \mathrm{K}=180^{\circ}$ | 2. |
| 3. $(4 \mathrm{x}+10)+(3 \mathrm{x}-5)=180$ | 3. |
| 4. $7 \mathrm{x}+5=180$ | 4. |
| $5 . \quad 7 \mathrm{x}=175$ | 5. |
| $6 . \quad \mathrm{x}=25$ | 6. |

Practice 5: $\quad$ Given: R in the interior of $\angle \mathrm{PQS}$; $\mathrm{m} \angle \mathrm{PQS}=70^{\circ} ; \mathrm{m} \angle \mathrm{PQR}=(14 \mathrm{x}-44)^{\circ} ; \mathrm{m} \angle \mathrm{RQS}=5 \mathrm{x}^{\circ} \quad$ Prove: $\mathrm{x}=6$

Sketch:

| Statement | Answer | Reason |
| :--- | :--- | :--- |
| 1. R in the interior of $\angle \mathrm{PQS} ; \mathrm{m} \angle \mathrm{PQS}=70^{\circ} ;$ <br> $\mathrm{m} \angle \mathrm{PQR}=(14 \mathrm{x}-44)^{\circ} ; \mathrm{m} \angle \mathrm{RQS}=5 \mathrm{x}^{\circ}$ | A. Substitution |  |
| 2. $\mathrm{m} \angle \mathrm{PQR}+\mathrm{m} \angle \mathrm{RQS}=\mathrm{m} \angle \mathrm{PQS}$ |  | B. Simplify |
| 3. $(14 \mathrm{x}-44)+5 \mathrm{x}=70$ |  | C. Division Prop. |
| $4.19 \mathrm{x}-44=70$ |  | D. Given |
| $5 . \quad 19 \mathrm{x}=119$ |  | E. Addition Prop. |
| $6 . \quad \mathrm{x}=6$ | F. Angle Addition Postulate |  |

Practice 6: Given: $\angle \mathrm{ABC}$ and $\angle \mathrm{CBD}$ are complementary $\angle \mathrm{DBE}$ and $\angle \mathrm{CBD}$ form a right angle $\quad$ Prove: $\angle \mathrm{ABC} \cong \angle \mathrm{DBE}$
$\underbrace{A}_{B}$

| Statement | Reason |
| :--- | :--- |
| 1. | 1. |
| $2 . \angle \mathrm{DBE}$ and $\angle \mathrm{CBD}$ are complementary | 2. |
| 3. | 3. |

Practice 7: Given: $\overrightarrow{A T}$ bisects $\angle \mathrm{SAX}$;
$\mathrm{m} \angle \mathrm{SAT}=(6 \mathrm{x}-4) ; \mathrm{m} \angle \mathrm{TAX}=(2 \mathrm{x}+28)$
Prove: $\mathrm{x}=8$

Sketch:

| Statement | Reason |
| :--- | :--- |
| 1. | 1. |
| 2. | 2. Definition of an angle bisector |
| 3. | 3. |
| 4. | 4. |
| 5. | 5. |
| 6. | 6. |
| 7. | 7. |

Practice 8: Given: $p \perp m \quad$ Prove: $\mathrm{x}=16$

$$
\mathrm{m} \angle 1=(4 \mathrm{x}+26)^{\circ}
$$

| $p \stackrel{1}{\longleftrightarrow}$ | Statement | Reason |
| :---: | :---: | :---: |
|  | 1. $p \perp m$ | 1. Given |
|  | 2. ___ is a right angle | 2. |
|  | 3. $\mathrm{m} \angle 1=$ | 3. |
|  | 4. | 4. |
|  | 5. | 5. |
|  | 6. | 6. |
